

# RabbitMQ Utilisation

Lorgnier Théo / Demoulin Raphaël

<https://github.com/745th/RabbitMQ>

## Ping-Pong :

Our algorithm work with channels not cleaned, but you must run 2 instances to clean all the old messages.

```
rabbitmqctl purge_queue A  
rabbitmqctl purge_queue B
```

We've tested locally on our computers and on the rabbitmq as a service, to test if we can communicate far away.

The code works the same locally or online. We just need to change the setHost into setURI.

We have 2 queues: A and B. The queue A is the default one, both of the clients connect here to consume the remaining messages, and they go to channel B to not consume their own message.

## Algorithm view in the course:

1st rule :  $\text{req? } \langle \text{START} \rangle \ \&\& \ \text{st}=\text{IDLE} \rightarrow \text{st}=\text{WAITING} ; \text{out!} \langle \text{init}(\text{ID}()) \rangle$

2nd rule :  $\text{in? } \langle \text{init}(\text{id}) \rangle \ \&\& \ \text{id} > \text{ID}() \rightarrow \text{st}=\text{START} ; \text{out!} \langle \text{OK\_INIT} \rangle$

3rd rule :  $\text{in? } \langle \text{init}(\text{id}) \rangle \ \&\& \ \text{id} < \text{ID}() \rightarrow \text{st}=\text{WAIT} ; \text{out!} \langle \text{init}(\text{ID}()) \rangle$

4th rule :  $\text{in? } \langle \text{OK\_INIT} \rangle \rightarrow \text{st}=\text{START} ; \text{out!} \langle \text{PING} \rangle$

5th rule :  $\text{in? } \langle \text{PING} \rangle \rightarrow \text{out!} \langle \text{PONG} \rangle$

6th rule :  $\text{in? } \langle \text{PONG} \rangle \rightarrow \text{out!} \langle \text{PING} \rangle$

## Our Algorithm:

1st rule :  $\text{req? } \langle \text{START} \rangle \ \&\& \ \text{st}=\text{IDLE} \rightarrow \text{st}=\text{WAITING} ; \text{out!} \langle \text{"START"} + \text{ID} \rangle ; \text{out!} \langle \text{"START"} + \text{ID} \rangle$

2nd rule :  $\text{in? } \langle \text{"START"} + \text{sID} \rangle \ \&\& \ \text{sID} > \text{ID}() \rightarrow \text{st}=\text{WAITING} ; \text{out!} \langle \text{"SECOND"} + \text{ID} \rangle$

3rd rule :  $\text{in? } \langle \text{"START"} + \text{sID} \rangle \ \&\& \ \text{sID} < \text{ID}() \rightarrow \text{st}=\text{WAITING} ; \text{out!} \langle \text{"FIRST"} + \text{ID} \rangle$

4th rule :  $\text{in? } \langle \text{"SECOND"} + \text{sID} \rangle \rightarrow \text{st}=\text{START} ;$

5th rule :  $\text{in? } \langle \text{"FIRST"} + \text{sID} \rangle \rightarrow \text{st}=\text{START} ; \text{out!} \langle \text{"PING"} + \text{ID} \rangle$

6th rule :  $\text{in? } \langle \text{"PING"} + \text{sID} \rangle \rightarrow \text{out!} \langle \text{"PONG"} + \text{ID} \rangle$

7th rule :  $\text{in? } \langle \text{"PONG"} + \text{sID} \rangle \rightarrow \text{out!} \langle \text{"PING"} + \text{ID} \rangle$

We can see differences in the 2 algorithms due to the implementation in rabbitmq requiring management of the different queues.

The messages SECOND and FIRST are used to decide if a client consume on A and publish on B or consume on B and publish on A

This intermediate management required the addition of another rule to put the channel in the right state when the ping-pong begin.
